

## CFI Platform Server with RocketStream

### Typical Deployment:

In this deployment scenario, a Windows version of CFI Platform Server with RocketStream is placed at both ends of a high bandwidth, high latency pipe. Platform Server with RocketStream accelerates the transfer achieving speeds up to 30 times faster than FTP or standard commercial applications. The Windows version of CFI Platform Server can then transfer the file into Platform Servers and applications on all major platforms including Windows, UNIX (AIX, HP-UX, Solaris), Linux, zLinux, iSeries, and the Mainframe.
